dependability and
total comfort

INDOOR COILS

BROAN® INDOOR COILS

Broan means dependability and innovation in air. A Broan System includes two main components. The outdoor section is either the air conditioner or the heat pump. The indoor section is a furnace with an indoor coil.

If you replace your air conditioner or heat pump, Broan highly recommends that you also replace the existing coil with a matched Broan coil. By doing this, you can ensure maximum efficiency and performance of your comfort system.

An old, dirty coil designed for a less efficient product will prevent your outdoor unit from performing at optimum efficiency, and may even damage your new air conditioner or heat pump compressor. Also, a coil designed for a different brand has not been matched or tested with your new system so efficiency ratings and performance can also be effected.

DESIGNED TO WORK WITH YOUR BROAN COOLING AND HEATING SYSTEM

Broan indoor coils are matched with all models of Broan split-system air conditioners and heat pumps to make your system runs at its most efficient levels. Depending on the installation configuration of your home, the type of coil used and the installation configuration may vary. Your Broan dealer will choose the appropriate coil for your home.

UNCASED COILS

This type of coil is encased by the ductwork during installation and is used for upflow and downflow applications.

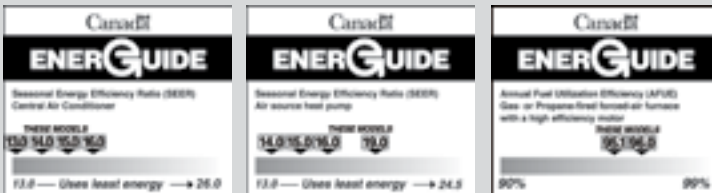

CASED COILS

This type of coil commonly sits on top of your furnace. Installation is shown in the furnace photo to the left. Cased coils are also available in horizontal configurations.

MICRO-CHANNEL COILS

All-aluminum Micro-Channel coils are lighter in weight and require less refrigerant. They offer increased reliability due to their innovative design.

PEACE OF MIND

Broan Coils offer a 10-year limited warranty when installed with a Broan heating or cooling system. Ask your Broan heating and cooling dealer for details.

Product registration required.
